COMBINATION THERAPY OF ANGIOTENSIN CONVERTING ENZYME INHIBITOR AND ALDOSTERONE ANTAGONIST FOR REDUCING MORBIDITY AND MORTALITY FROM CARDIOVASCULAR DISEASE

5

ABSTRACT

Combinations of an ACE inhibitor, an aldosterone
10 antagonist, and a loop diuretic are described for use in
treatment of circulatory disorders. Of particular
interest are therapies using captopril, enalapril or
lisinopril co-administered with spironolactone. This
co-therapy would be particularly useful to reduce the
15 death rate or the number of non-fatal hospitalizations
or prevent the progression of congestive heart failure
in patients with cardiovascular disease.
